

## Power Line to Motor

To connect the motor to the control box, you need to run the power line to the motor. Please ensure the main line is disconnected from power source first.

The power line to the motor has 3 wires with O clips attached. Blue, Brown and green. It's the shorter length wire.

Green is ground. Brown and blue are the live wires. They get attached to either side of one the bridged terminals on the motor.

## Power Line to the control Unit

The Second set of wires coming out of the control unit are the main power lines going to a plug or for hardwiring. (longer length wire)

You need a Single Phase 208-240V 25A power supply to run this system.

The complete information for wiring can be observed on the Plate on the motor for your electrician's reference.

Green is Ground Brown and blue are the hot wires.

## Finishing the install

To turn the machine on for the first time, please ensure water is running to the pump, check all connections and fittings are securely attached.

Turn the machine on with the green button. Purge the lines of any air by holding the trigger open. Once the trigger is closed there will be a few seconds time delay, the machine will shut off and remain in standby until the trigger is opened again.

The machine should not remain in standby unattended. must be shut off (red button) and the pressure from the line needs to be released at the end of the job. The machine turn off completely after 30mins of not being use as a safety feature.

## Notes about the machine

This Pressure washer unit uses a Remote control transmitter in the handle of the supplied gun. Its paired with the receiver on the control unit.

Using a different gun other than the supplied unit will circumvent the auto start/stop function on the machine.

The guns are replaceable and programing instructions for pairing a new gun are available upon request.
